

Women's Health Resolution (2021)

The female body has been understudied and ignored in medical research since the beginning of science. Attitudes and education are changing for the better within the medical and scientific establishment, but much more needs to be done. When women's bodies and conditions are understudied, and consequently undiagnosed and misdiagnosed, women's health is seriously impaired. We deserve healthcare based on accurate information and protocols that promote healing.

Furthermore, women cannot make informed and intelligent decisions about their own bodies, nor can they control their own health care choices and treatments, if they are unable to get complete and accurate information from doctors, scientists and pharmaceutical researchers. This is a denial of a basic human right.

We must develop and use our voices to become fully equal in the eyes of medicine, as both biological and transgender females. The quest for women's equality is our WLCJ inheritance and must be our legacy.

Whereas Jewish tradition cherishes the sanctity of life (B. Sanhedrin 74a), and Judaism tells us that physicians have an obligation to heal (Shulchan Arukh Yoreh De'ah 336:1); and

Whereas male physiology alone has historically been the basis for medical research (beginning at the cellular level), diagnostic tools, and treatments; and

Whereas women are now known to be at a greater risk than men for misdiagnosis, improper treatments and medical complications; and

Whereas diseases primarily affecting women are often understudied; and

Whereas gender disparity exists in diagnosis and treatment of many diseases; and

Whereas some populations of women (such as the elderly, the differently abled, those who are pregnant and women of color) are even less represented in all levels of medical research than women in general, resulting in quantifiably poorer outcomes; and

Whereas biologically, women metabolize drugs differently from men.

Therefore, BE IT RESOLVED that Women's League for Conservative Judaism:

1. Supports the creation of women's initiatives in medical research, policies and education.
2. Supports research leading to individualized gender-based medical care, so physicians and healthcare providers can provide the best options for treatments and medications.
3. Supports public education, awareness and medical education for physicians and healthcare providers regarding gender disparities.
4. Advocates for increased public and private funding, supporting research with the goal of affordable, equitable and high-quality health care for all.
5. Supports WLCJ affiliates in the sponsoring of educational programming to advocate best outcomes for women's health.
